

Project: Customer journey analysis using user session data

Description:

During my time at NTT Data, I performed an analysis of user session data to uncover behavioral patterns and better understand how experienced and new users interact with various applications.

Key steps included:

- **Data Cleaning:** Applied multiple rules to filter out non-human behavior, such as unusually long event durations and sessions with minimal engagement.
- **Behavior Segmentation:** Differentiated user behaviors based on login status, frequency of visits, and number of applications accessed per session.
- **Session Filtering:** Identified valuable sessions by focusing on multi-application usage and returning users, excluding those with only one application and low engagement.
- **Insights:** Discovered that expert users (often logged in) tend to use more applications and have more informative sessions.

Tools & Skills: Python, Pandas, Data Cleaning, Exploratory Data Analysis (EDA).
